

Forecasting the Future

Predicting Pressure
Injury in SCI and TBI
Patients

*Shishir Shah DO, ABPM, CWS
Director Advanced Wound Healing Center
Dignity Health, Phoenix AZ
October 2021*

Objectives

- Review Pressure Ulcer Identification
- Review Current Scoring Methods
- Advances in Predictive Modeling
- Interventions for prevention and protection

A man with short grey hair, wearing a black flat cap and a white ribbed zip-up sweater, is seated in a wheelchair. He is looking slightly to the right of the camera with a neutral expression. The background is a dark, textured wall with some light-colored diagonal lines.

What's your number-one
day-to-day living problem?

CHRISTOPHER

Injured in 1980 at age 15, Quadriplegic

8%

**SCI- PU
lifetime**

Definition of Pressure Ulcer

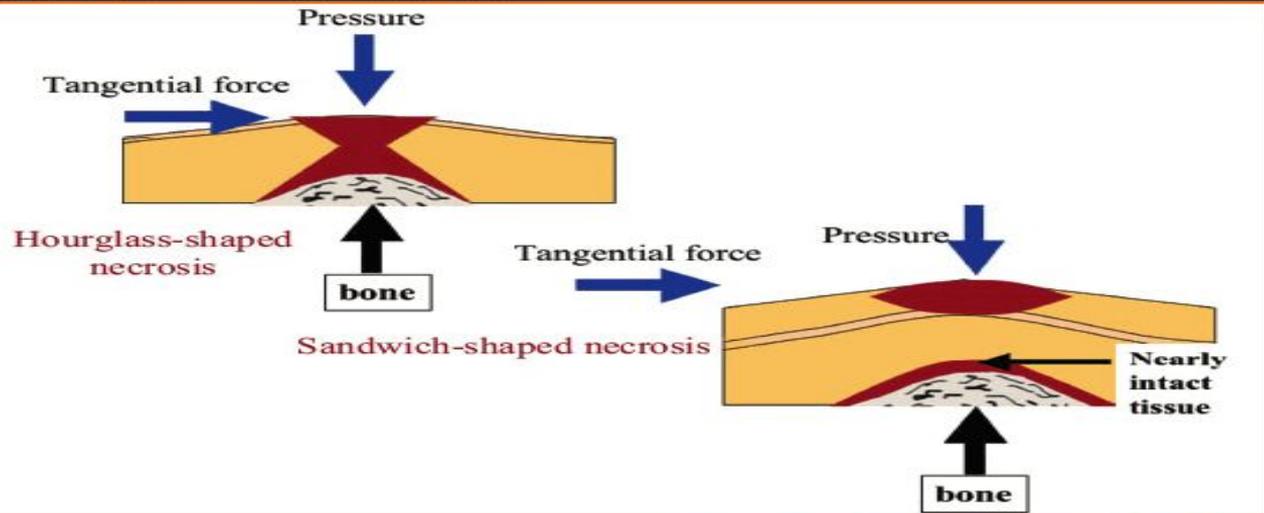

- An area of unrelieved pressure over a defined area, usually over a bony prominence such as the sacrum
- Pressure leads to ischemia, cell death, and tissue necrosis, as capillaries are compressed and the blood flow is restricted
- Muscle is the most sensitive tissue to pressure, skin is the most resistant

Most common pressure ulcer sites

- Ischium 28%
- Sacrum 17-27%
- Trochanter 12-19% (Bears weight when patient is in a sitting position)
- Other commonly affected sites include coccyx, heel, and malleolus

Assessing Dark Skin

- Have a high index of suspicion
- Use good lighting
- Compare Skin Color to surrounding area
- Enhance Visual Assessment by moistening skin (sebum vs Ceramide)
- Superficial are easily identified
- Palpate skin for edema
- Variation - Stg 1 (32%) vs DTI(67/8%) –African American
- Perfusion/Thermography
- Healing changes pigmentation

TIMING IS EVERYTHING

- The median time to pressure ulcer occurrence was 5 hours at mild or moderate risk
- 3.5 hours at high risk
- 3 hours at very high risk on the Braden scale
- The optimal time interval for position change was 3 hours at mild and moderate risk, 2 hours at high and very high risk of Braden scale.

Adrenergic Receptors in Insensitive Skin of Spinal Cord Injured Patients

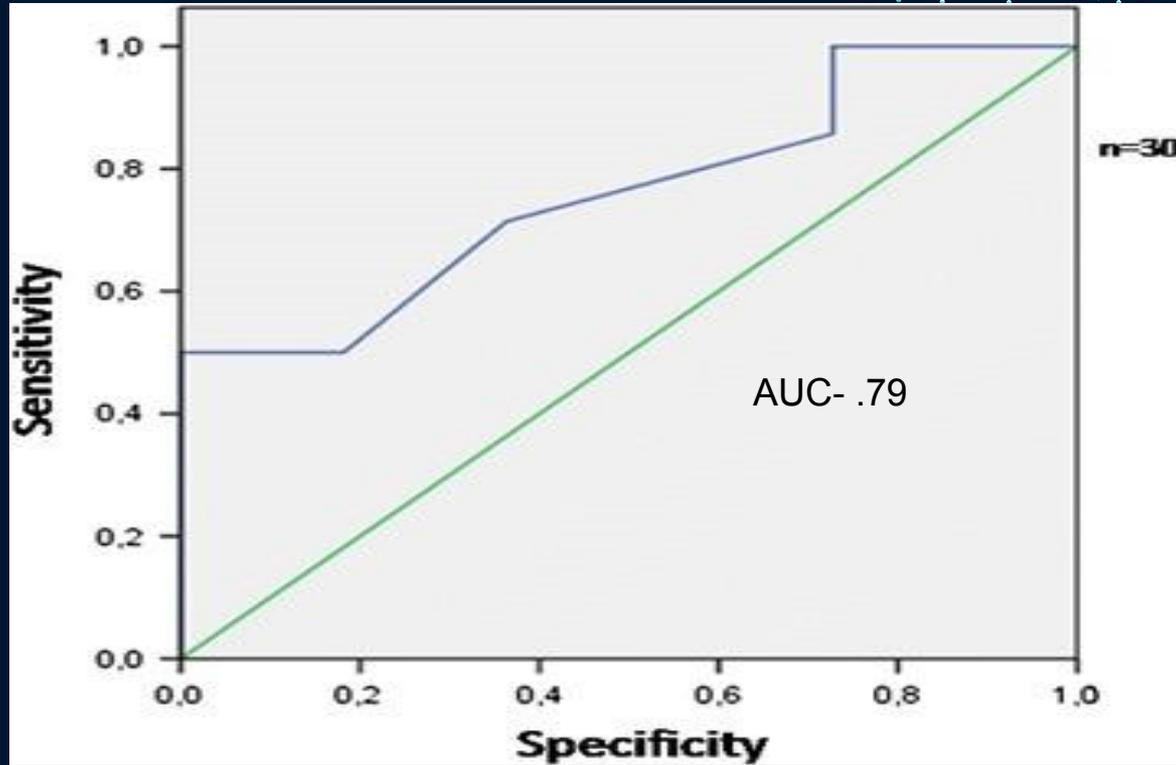

Nutritional Parameters in TBI/NTBI

Italian study with 30 pts admitted in a neuro rehab institute
age 45-76 , 16 male, 14 female, 8 TBI, 11 ischemic CVA, and 11 with anoxic brain injury

Parameters:

- age
- BMI
- Mid Arm Circumference (MAC)
- TBW
- Energy exp, Caloric intake,
- Hgb
- Iron, Albumin
- WBC
- CA
- Cr
- Glucose
- Age, Disease duration

AUC for Albumin to Predict Pressure Ulcers in TBI and NTBI

COMMON TOOLS IN PU RISK ASSESSMENT FO SCI/TBI

- **Braden:** Moisture, mobility, nutrition, friction/shear , activity, sensory perception
- **Scipus-** activity, mobility, level of spine injury, moisture/incontinence, hosp versus snf, nutrition other factors, (such as age, tobacco use/smoking, pulmonary disease, cardiac disease abnormal blood glucose control, renal disease, and impaired cognitive function)
- **Scipus A** (acute hosp)- extent of paralysis, incontinence, nutrition, pre-existing disease (pulm), mobility, level of activity
- **Norton** - activity, mobility, incontinence, physical condition, and mental condition.

ORIGINAL BERGSTORM/BRADEN STUDY

- 100% sensitive in 2 studies of N=100 for scores 16-23
- Steep drop of sensitivity at scores 15 or below
- Predominantly Caucasian elderly male
- Mostly CVA and orthopedic surgeries
- AAJC 2013 study 7790 ICU – Sensitivity of 95% and specificity of 20% . There is a low PPV in ICU .114 and NPV of .977
- 2016 Meta-analysis of 41,450 pts and 1058 PU showed sensitivity of 89% and specificity of 28% with an AUC of .78

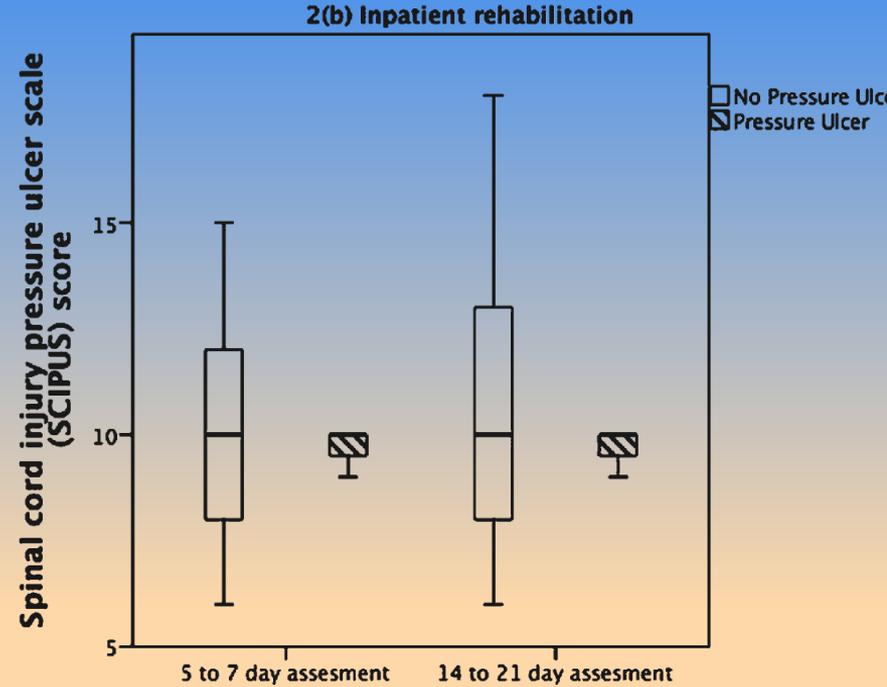

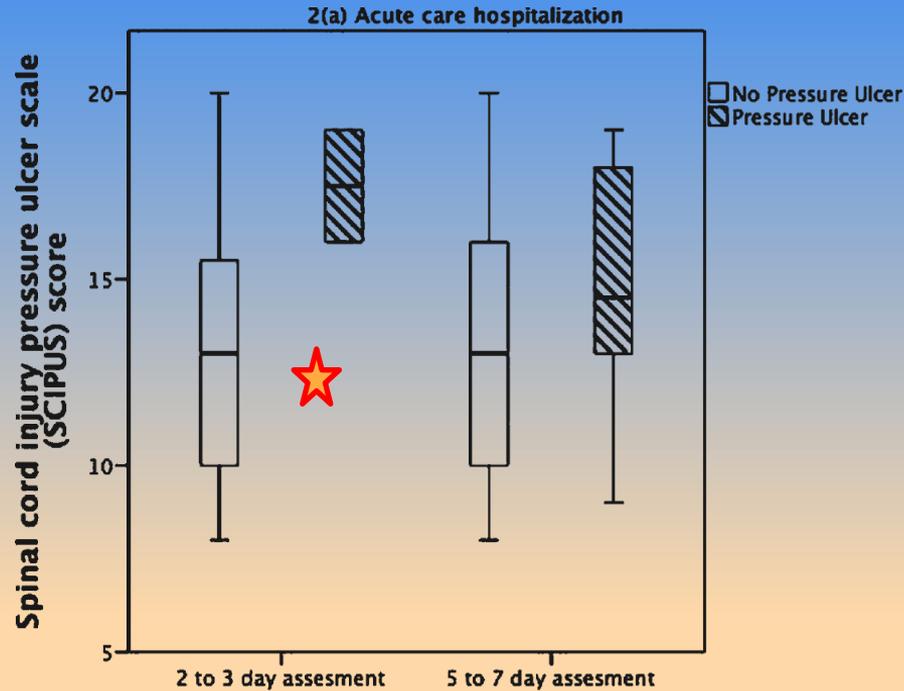

BRADEN SCALE

Sensory	Complete	Limited	Slight	None	4
Moisture	Constant	Very	Slight	Rare	4
Activity	Bed	Chair	Walks some	Walks a lot	4
Mobility	Immobile	Very Limited	Slightly Limited	No Limits	4
Nutrition	Very Poor	Rarely	Adequate	Good	4
Friction	Problem	Potential	None		3

SCIPUS SCALE

- OVER 38 SCALES FOR PU PREDICTION- MOST STUDIED ARE BRADEN, NORTON, AND WATERLOO
- NO SCALE ADDRESS MOTOR IMMOBILITY AND SENSORY DEFICIT BELOW LEVEL OF INJURY
- SCIPUS HAS DEVELOPED 15 PARAMETERS IN 7 CATEGORIES (0 is absent, 1 or 2 if present)
 - 1)Activity
 - 2)Mobility
 - 3)Severity (Complete, Autonomic Reflexia, or Severe spasticity)
 - 4)Urine Incontinence
 - 5)Pre-existing (tobacco, ag, Pulmonary disease, Cardiac Disease, DM/glucose, Renal Disease, Impaired cognitive function)
 - 6)Residence in SNF or Hospital
 - 7)Nutrition [Alb < 3.4 pr protein < 6.4 or Anemia (Hct < 36)]

SCI Scale Comparisons

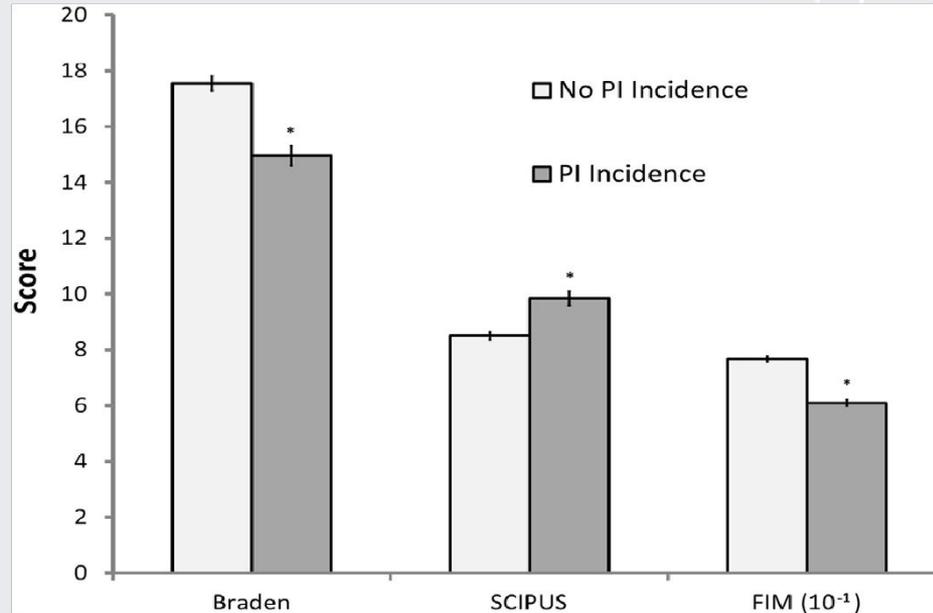

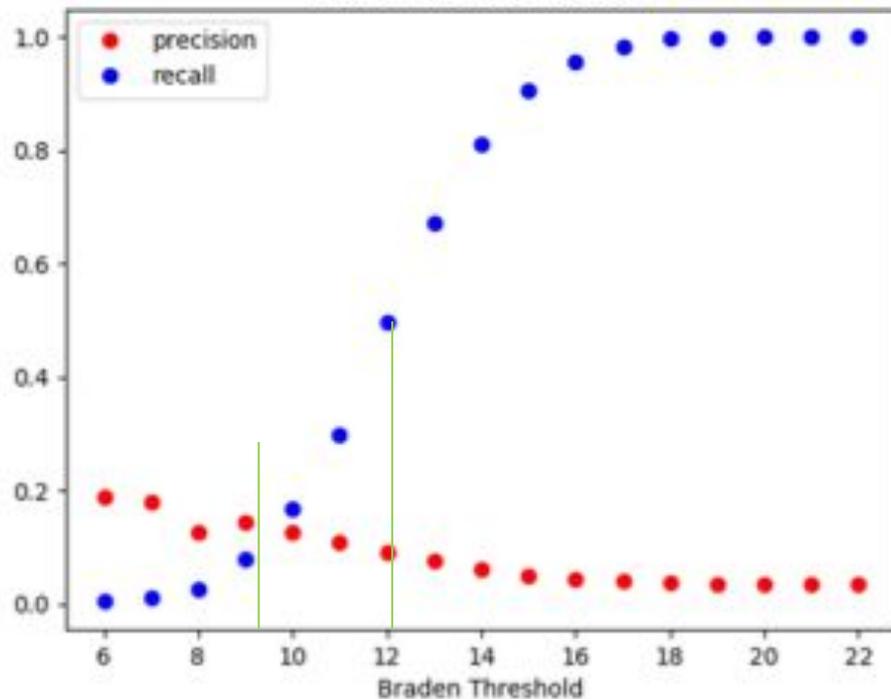

Fig 1 Mean differences in scores between outcome measure scores for individuals with and without PI incidence. *Significance at $P < .01$; error bars denote SEM. SCIPUS $n = 571$; Braden $n = 173$; FIM $n = 615$.

Machine Learning and PU prediction

- Stanford Study reviewing EHR data for approximately 54,000 patients admitted to the ICU of Beth Israel Deaconess Medical Center between 2001 and 2012
- 1,690 admissions where a PU was recorded on day 2 or beyond, evaluated the prognostic value of the Braden score measured within the first 24 hours.
- Trained a range of machine learning algorithms using demographic parameters, diagnosis codes, laboratory values and vitals available from the EHR within the first 24 hours.

Braden Score Prediction

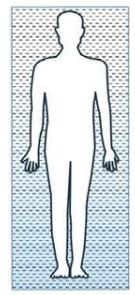

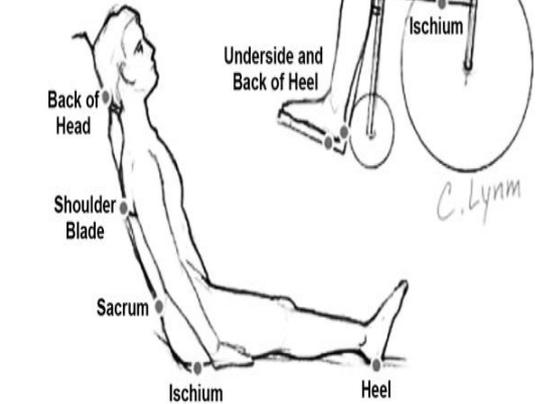

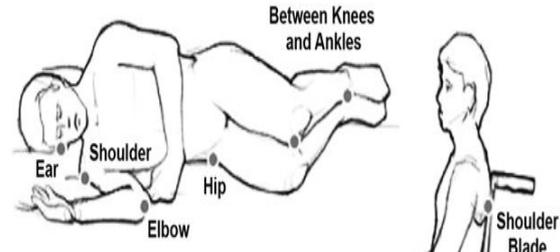

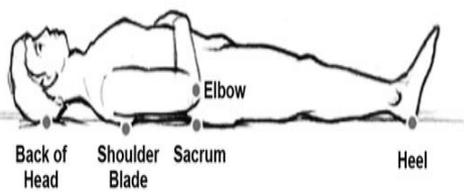

Precision @12- .09
Recall @12-.5

Precision @ 9 -.15
Recall - @9 -.08

Participants were instructed to reach forward to the keyboard (which was positioned a set distance from each participant) for 5 minutes.

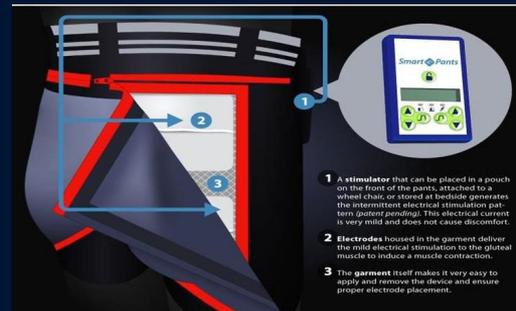

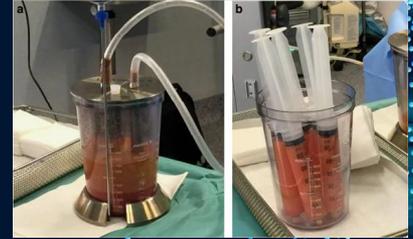

Moveable tray to change position of keyboard

FIGURE 1: The positioning of equipment in Strand B.

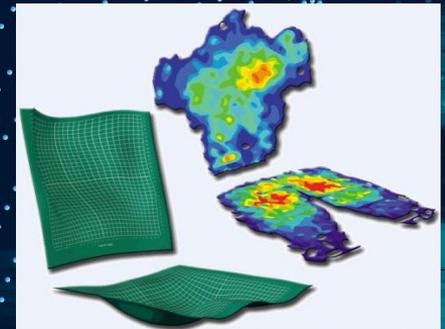

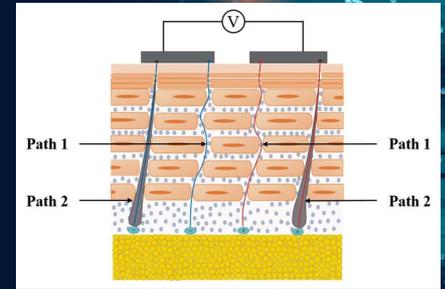

New Frontiers in Prediction and Prevention

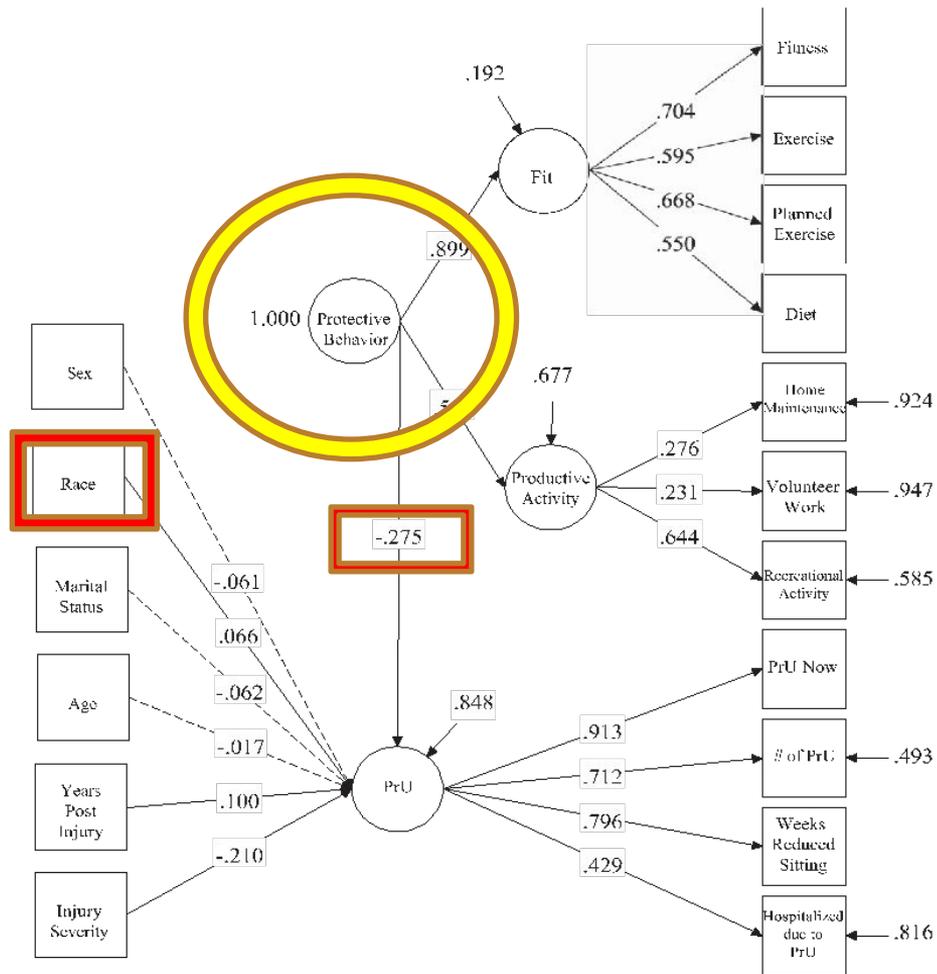

- Biomarkers – Circulatory adipose and myogenic gene expressions and correlation with IMAT
- Lipofilling
- Smart E Pants
- Bedside Technologies

BEDSIDE EARLY DETECTION

- Ultrasound
- Thermography
- Light Technology
- Subepidermal Moisture Detection- - Capacitance
- Pressure Mapping /wireless matt sensors

Note: A solid line indicates a significant effect and a dashed line indicates a non-significant effect.

A latent structural equation model of protective behaviors and pressure ulcer outcomes among people living with spinal cord injury C Li, ND DiPiro and J Krause . Spinal Cord (2017) 55, 135–140

SOCIAL NETWORKING

- 35 French Rehab centers with 1327 pts surveyed in initial post-trauma period of 2 years
- 11 yr follow up on 547 (221 died)
- 73% PU in the 1st period after injury
- 4 key factors for PU
 - Incomplete motor impairment – Odds ratio of .5
 - Ability to walk – Odd ratio .2
 - PU during initial trauma phase – Odds 2.7
 - **Lack of social network Odds 3.1**

Summary

- Scales have imperfections.
- Simplicity and universal use makes Braden a convenient yet suboptimal choice
- Facilities need to incorporate scoring based on patient type and location
- Further research integrating EMR data and machine learning will allow multiparameter risk assessment
- Cost, ease of use and adoption lag may prohibit entry of new technologies
- Go back to the basics and provide custom solutions for each patient.

**“Every battle is won
before it is fought”**
